SPECIAL INSTRUCTIONS

1. It is necessary to measure both sides independently for proper fit. For most boats, each side is different.
2. Use a steel or fiberglass measuring tape long enough to measure the entire length.
3. Start at the bearing point of the bow pulpit eye. (Located where the lifeline pin rests against the inside of the pulpit eye).
4. Run your tape outboard of the stanchions in line with the lifeline holes to the bearing point of the stern rail eye.

NOTE: Measurements should be to the nearest 1/4 inch. We are not responsible for improper self measurements. We recommend that you send us your old lifelines to insure accuracy.

If you are sending your old lifelines, put all adjustable fittings such as turnbuckles and pelican hooks in the position they were on the boat initially.

If you need assistance please call or email us.
